

Infrastructure. Automation. Evidence.

Senior Systems & Infrastructure Engineer

Microsoft Azure · Microsoft 365 · PowerShell · Python · APIs

600+

SharePoint sites inventoried

187

secrets migrated

13

automation containers

ENGINEERING FOCUS

I combine infrastructure operations with automation and security. My work spans Microsoft platforms, access governance, endpoint operations and evidence generation.

SELECTED WORK

Five documented cases, including a vulnerability-remediation pilot. Three synthetic demonstrations accompany this portfolio: event reporting, migration planning and containerized browser checks.

ROLE FOCUS

Senior Systems Engineer · Cloud Infrastructure Engineer · Security Automation Engineer

linkedin.com/in/kristiangutierrez

Microsoft 365 governance

SharePoint Online · Microsoft Graph · PnP PowerShell

600+

sites inventoried

Access

before / after validation

Pilot

before bulk changes

CONTEXT

Manage ownership, membership and permissions across a large SharePoint environment while retaining control and an audit trail.

MY CONTRIBUTION

Automated site inventory and access review, integrated Entra ID authentication, and prepared controlled ownership transfers, backups and Excel reports.

CONTROLS AND VALIDATION

Owner, member and administrator checks; before-and-after access validation; execution records; a pilot on selected sites.

SCOPE AND EVIDENCE

600+ is the inventory scope, not a count of sites modified. [Public scope and project evidence on LinkedIn](#).

Azure Key Vault migration

KeePass · KPScript · PowerShell · Azure RBAC

187

secrets migrated

0

reported errors

0

skipped entries

CONTEXT

Move locally managed secrets from KeePass into a centralized Azure service for use by applications and automation.

MY CONTRIBUTION

Automated entry transformation and migration with PowerShell and KPScript, preserving source references and producing a reconciliation report.

CONTROLS AND VALIDATION

Tenant, subscription and permission checks; a temporary write test; simulation before import; removal of temporary files at completion.

SCOPE AND EVIDENCE

Completed migration: 187 secrets, zero errors and zero omissions. No credential values are included in this material. [Public result and evidence on LinkedIn](#).

Vulnerability orchestration

Defender / Wazuh · Action1 · PowerShell · Python

PILOT

controlled group of devices

5 stages

detection to evidence

Ongoing

workflow validation

CONTEXT

Connect security findings to remediation and post-change verification, retaining evidence at each step.

MY CONTRIBUTION

Developing an integration for detection, CVE/KB/device correlation, selective Action1 deployment, validation and SharePoint evidence.

CONTROLS AND VALIDATION

The pilot scope includes preflight checks, connectivity, pending reboots, retries and failed-job tracking. Post-change validation checks the result of each update.

SCOPE AND EVIDENCE

Pilot with a group of devices. Success rates and time savings have not been published. Proposed measures: coverage, successful jobs, exceptions and time to verified closure. [Project status on LinkedIn](#).

Weekly security reporting

Wazuh · Python · Bash · Microsoft Graph · SharePoint

Weekly

scheduled execution

CSV / PDF

structured output

Graph

storage and email integration

CONTEXT

Turn security events into a repeatable reporting workflow that connects generation, storage and distribution of evidence.

MY CONTRIBUTION

Implemented event extraction and correlation by agent, classification, CSV/PDF generation, SharePoint publication and email distribution. Bash and cron coordinate scheduled execution.

CONTROLS AND VALIDATION

Period calculation and execution logs support diagnosis. The portfolio code demonstrates local aggregation, duplicate handling and timezone-aware filtering with synthetic events.

SCOPE AND EVIDENCE

The included demo outputs CSV and HTML. Live Wazuh, Graph, SharePoint and PDF integration are outside its scope. [Professional workflow described on LinkedIn.](#)

Containerized automation

Python · Selenium · Docker · Linux

1 to 13

containers in the real project

Independent

execution environments

Synthetic

local demonstration fixture

CONTEXT

Automate operational queries and distribute browser execution across independent Linux containers.

MY CONTRIBUTION

Developed and deployed Selenium-based robots in Docker, scaling execution from one to thirteen containers and processing their outputs.

CONTROLS AND VALIDATION

The portfolio demo provides a local fixture, a readiness check, bounded waits, structured results and non-zero failure exits. Compose can start multiple workers.

SCOPE AND EVIDENCE

Container count is not a measured throughput multiplier. The demo runs independent copies of one smoke check; it does not reproduce a production queue. Docker execution requires a running engine. [Professional project description](#).

Code you can inspect

01 / WAZUH-LIKE EVENT REPORTING

Python, standard library. Synthetic JSON input becomes CSV and HTML summaries. Checks cover duplicate events, date-window boundaries, timezone handling and invalid severity.

02 / KEY VAULT MIGRATION PLANNER

PowerShell 7. Converts synthetic entry titles to proposed secret names and rejects collisions and duplicate source IDs. Metadata only; no credentials or cloud calls.

03 / DOCKER AND SELENIUM

A local browser fixture and independent container workers. Readiness checks, bounded waits, JSON results and failure exit codes make behavior reviewable.

WHAT THE EXAMPLES REPRESENT

Illustrative portfolio material prepared separately from professional systems. They contain synthetic data and demonstrate selected engineering patterns. They are not production exports or proof of operational performance.

VALIDATION AND OPERATING INSTRUCTIONS

The accompanying repository includes README files in English and Spanish, a runbook, tests, and a validation record identifying what was executed and what still requires a Docker host.
